Problem 11. Let $M_{1}=\left(Q_{1}, \Sigma, \delta_{1}, q_{1}, F_{1}\right)$ and $M_{2}=\left(Q_{2}, \Sigma, \delta_{2}, q_{2}, F_{2}\right)$ be two DFSM over the alphabet $\Sigma$. Let $L\left(M_{1}\right)$ and $L\left(M_{2}\right)$ be the languages accepted by $M_{1}$ and $M_{2}$, respectively.
Construct a DFSM $M=(Q, \Sigma, \delta, q, F)$ whose language $L(M)$ is the intersection of $L\left(M_{1}\right)$ and $L\left(M_{2}\right)$. Write down $Q, \delta, q$, and $F$ explicitly.
Hint: $M$ simulates the parallel execution of $M_{1}$ and $M_{2}$. For that to work, $M$ "remembers" in its state the state of $M_{1}$ as well as the state of $M_{2}$. This can be achieved by defining $Q=Q_{1} \times Q_{2}$.
Demonstrate your construction with the following DFSMs.

Problem 12. Let $L$ be the language of properly nested strings over the alphabet $\Sigma=\{[], o$,$\} . A word w$ is properly nested if it contains as many opening as closing brackets and every prefix of $w$ contains at least as many opening brackets [ as closing ]. (Example: oo [] [o [o]] is properly nested, but oo] [ is not.) Show by means of the Pumping Lemma that $L$ is not regular.

Problem 13. Let $M_{1}$ be the DFSM with states $\left\{q_{0}, q_{1}, q_{2}\right\}$ whose transition graph is given below. Determine a regular expression $r$ such that $L(r)=L\left(M_{1}\right)$. Show the derivation of the the final result by the technique based on Arden's Lemma (see lecture notes).

Problem 14. Let $r$ be the following regular expression.

$$
(a b+b a)^{*}+b b
$$

Construct a nondeterministic finite state machine $N$ such that $L(N)=L(r)$. Show the derivation of the result by following the technique presented in the proof of the theorem Equivalence of Regular Expressions and Automata (see lecture notes).

Problem 15. Construct a Turing machine $M=\left(Q, \Gamma, \sqcup,\{0,1\}, \delta, q_{0}, F\right)$ such that $L(M)=\left\{1^{k} 01^{k+1} \mid k \in \mathbb{N}\right\}$. Write down $Q, \Gamma, F$ and $\delta$ explicitly.
