Klausur 1

Berechenbarkeit und Komplexität

22. November 2019

Part 1 NFSM2019

Let N be the nondeterministic finite state machine

$$(\{q_0, q_1, q_2, q_3, q_4, q_5, q_6, q_7\}, \{0, 1\}, \nu, \{q_0\}, \{q_1, q_3, q_5, q_7\}),$$

whose transition function ν is given below.

1		no
----------	--	----

Is $1001100111 \in L(N)$?

The sequence is not defined by the transition.

2	yes	
----------	-----	--

Is $101111 \in L(N)$?

Follow the states $q_0, q_1, q_3, q_5, q_4, q_6, q_5$.

3		no
----------	--	----

Is $L(N)$ finite?

4	yes	
----------	-----	--

Does there exist a regular expression r such that $L(r) = \overline{L(N)} = \{0, 1\}^* \setminus L(N)$?

$L(N)$ is regular and so is its complement.

5	yes	
----------	-----	--

Is $\overline{L(N)}$ recursively enumerable?

$L(N)$ is regular. Hence, $\overline{L(N)}$ is regular, and thus also recursively enumerable.

6	yes	
----------	-----	--

Is there a deterministic finite state machine M with less than 2019 states such that $L(M) = L(N)$?

According to the subset construction, there must be a DFSM with at most $2^8 = 256$ states.

7	yes	
----------	-----	--

Is there an enumerator Turing machine G such that $Gen(G) = L(N)$?

8	yes	
----------	-----	--

Does there exist a deterministic finite state machine D such that $L(D) = L(N) \circ \overline{L(N)}$?

$L(N)$ and $\overline{L(N)}$ are both regular. Concatenation of two regular languages gives a regular language.

Part 2 Computable2019

Let M be a Turing machine such that whenever M accepts a word, it does so in no more than 2019 steps.

9	yes	<input type="checkbox"/>
---	-----	--------------------------

Is $L(M)$ recursively enumerable?

10	yes	<input type="checkbox"/>
----	-----	--------------------------

Is $L(M)$ recursive?

Start M with input w and execute 2019 steps. If w has been accepted then $w \in L(M)$, otherwise $w \notin L(M)$. Therefore, $L(M)$ and $\overline{L(M)}$ are both recursively enumerable.

11	<input type="checkbox"/>	no
----	--------------------------	----

Let L be a recursively enumerable language. Can it be concluded that $L(M) \cap L$ is recursive?

Intersection of recursive and recursively enumerable languages is recursively enumerable but not necessarily recursive.

12	yes	<input type="checkbox"/>
----	-----	--------------------------

Let L be a recursively enumerable language. Can it be concluded that \overline{L} is recursive, provided that \overline{L} is recursively enumerable?

If a language L and its complement \overline{L} are both recursively enumerable, then by Theorem 8 (Skriptum) L is recursive.

13	yes	<input type="checkbox"/>
----	-----	--------------------------

Does there exist a Turing-computable function that is not LOOP-computable?

14	<input type="checkbox"/>	no
----	--------------------------	----

Is every total WHILE-computable function also LOOP-computable?

15	yes	<input type="checkbox"/>
----	-----	--------------------------

Let f be a LOOP-computable function and $g : \{\#\}^* \rightarrow \{\#\}^*$ be defined by $g(\#^n) = \#^{f(n)}$ for all $n \in \mathbb{N}$. Is g Turing-computable?

Part 3 Pumping2019

Let

$$L_1 = \{ a^m b^n \mid m, n \in \mathbb{N}, m \leq n \},$$

$$L_2 = \{ a^n b^n \mid n \in \mathbb{N}, n < 2019 \}.$$

16	<input type="checkbox"/>	no
----	--------------------------	----

Is there a regular expression r such that $L(r) = L_1$?

17	yes	<input type="checkbox"/>
----	-----	--------------------------

Is there a deterministic finite state machine M such that $L(M) = \overline{L_2} := \{a, b\}^* \setminus L_2$?

L_2 is regular, i.e., its complement $\overline{L_2}$ is also regular.

18	yes	<input type="checkbox"/>
----	-----	--------------------------

Is there an enumerator Turing machine G such that $\text{Gen}(G) = L_1$?

19	yes	<input type="checkbox"/>
----	-----	--------------------------

Is there a Turing machine M such that $L(M) = L_1 \cup L_2$?

20	yes	<input type="checkbox"/>
----	-----	--------------------------

Is there a deterministic finite state machine D such that $L(D) = L_1 \cap L_2$?

The language $L_1 \cap L_2$ is finite and thus regular.

Part 4 WhileLoop2019

Let a function $f : \mathbb{N}^3 \rightarrow \mathbb{N}$ be defined by

$$f(x, y, z) := \begin{cases} y & \text{if } x = y, \\ z & \text{if } x < y, \\ 0 & \text{otherwise.} \end{cases}$$

Let f' be defined like f , but with the exception that f' is undefined if one of the arguments is equal to 2019.

21	yes	<input type="checkbox"/>
----	-----	--------------------------

Is f a LOOP computable function?

22	<input type="checkbox"/>	no
----	--------------------------	----

Is f' a LOOP computable function?

23	yes	<input type="checkbox"/>
----	-----	--------------------------

Is f' a WHILE computable function?

Part 5 Open2019

(2 points)

Let $N = (Q, \Sigma, \delta, q_0, F)$ be a nondeterministic finite state machine with $Q = \{q_0, q_1, q_2, q_3\}$, $\Sigma = \{a, b\}$, $S = \{q_0\}$, $F = \{q_0, q_3\}$, and transition function δ as given below.

1. Let X_i denote the regular expression for the language accepted by N when starting in state q_i .

Write down an equation system for X_0, \dots, X_3 .

2. Give a regular expression r such that $L(r) = L(N)$ (you may apply Arden's Lemma to the result of 1).

$$X_0 = bX_1 + (a + b)X_2 + \varepsilon$$

$$X_1 = aX_2$$

$$X_2 = bX_3$$

$$X_3 = bX_1 + \varepsilon$$

$$r = ((a + b) + ba)(bba)^*b + \varepsilon$$

or alternatively:

$$r = ((a + b) + ba)b(bab)^* + \varepsilon$$
