

Basic JML

Assertions

Definition:

JML: two kinds of assertions.

assert P: P needs verification.

assume *P*: *P* can be assumed.

JML as required for the basic Hoare calculus.

Assertions

assume. assert.

Loop assertions.

loop_invariant, decreases.

Method contracts.

requires, ensures.

The JML expression language. \forall, \exists, ...

Specifying simple procedural programs.

Wolfgang Schreiner

http://www.risc.jku.at

5/36

Loop Assertions

```
int i = n;
int s = 0;
//@ loop_invariant i+s == n;
//@ decreases i+1;
while (i \ge 0)
ſ
  i = i - 1;
  s = s+1;
}
```

- loop_invariant specifies a loop invariant, i.e. a property that is true before and after each iteration of the loop.
- decreases specifies a termination term, i.e. an integer term that decreases in every iteration but does not become negative.

Useful for reasoning about loops.

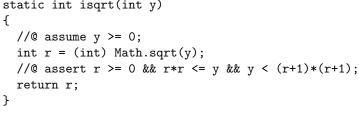

6/36

//@ assume n != 0; int i = 2*(m/n); //@ assert i == 2*(m/n): Low-level specifications. Wolfgang Schreiner http://www.risc.jku.at Assertions in Methods static int isqrt(int y) ſ //@ assume y >= 0; int r = (int) Math.sqrt(y);

Makes a difference for reasoning tools.

An assertion is a command that specifies a property which should always hold when execution reaches the assertion.

A runtime checker must test both kinds of assertions.

- assume specifies a condition P on the pre-state.
 - Pre-state: the program state before the method call.
 - The method requires *P* as the method's precondition.
- \blacksquare assert specifies a condition Q on the post-state.
 - **Post-state**: the program state after the method call.
 - The method ensures *Q* as the method's postcondition.

Low-level specification of a method.

Design by Contract

Method Contracts

@ @

{

}

Wolfgang Schreiner

/*@ requires y >= 0;

@ ensures \result >= 0

return (int) Math.sqrt(y);

static int isqrt(int y)

Higher-level specification of a method.

The JML Expression Language

Atomic Formulas

 $\forall x \in T : P \Rightarrow Q$

 $\exists x \in T : P \land Q$

&& \result*\result <= y

requires specifies the method precondition

ensures specifies the method postcondition

May refer to method parameters.

&& y < (\result+1)*(\result+1); @*/

May refer to method parameters and to result value (\result).

http://www.risc.jku.at

Primitive operators and pure program functions (later).

■ Connectives: !P. P&& Q. P || Q. P==> Q. P<== Q. P<==> Q. P<=!=> Q.

 $\neg P, P \land Q, P \lor Q, P \Rightarrow Q, Q \Rightarrow P, P \Leftrightarrow Q, \neg (P \Leftrightarrow Q).$

Informal property expression: (* sum of a and b equals c *)

Any Java expression of type boolean: a+b == c

Does not affect truth value of specification.

• Universal quantification: (\forall T x; P; Q)

Existential quantification: (\exists T x; P; Q)

Strongly typed first-order predicate logic with equality.

Pre- and post-condition define a contract between a method (i.e. its implementor) and its caller (i.e. the user).

- The method (the implementor) may assume the precondition and must ensure the postcondition.
- The caller (the user) must ensure the precondition and may assume the postcondition.
- Any method documentation must describe this contract (otherwise it is of little use).

The legal use of a method is determined by its contract (not by its implementation)!

Wolfgang Schreiner

http://www.risc.jku.at

9/36

Postcondition and Pre-State

// swap a[i] and a[j], leave rest of array unchanged /*0 requires

- 0 a != null &&
- 0 <= i && i < a.length && 0 <= j && j < a.length; @ ensures

```
@ a[i] = \old(a[j]) && a[j] == \old(a[i]) &&
```

```
@ (* all a[k] remain unchanged where k != i and k != j *) @*/
static void swap(int[] a, int i, int j)
```

```
{ int t = a[i]; a[i] = a[j]; a[j] = t; }
```

- Variable values in postconditions:
 - x ... value of x in post-state (after the call).
 - Except for parameters which are always evaluated in the pre-state.
 - old(x) ... value of x in pre-state (before the call).
 - \old(E) ... expression E evaluated with the value of every variable x in E taken from the pre-state.

```
Variable values may change by the method call (more on this later).
```

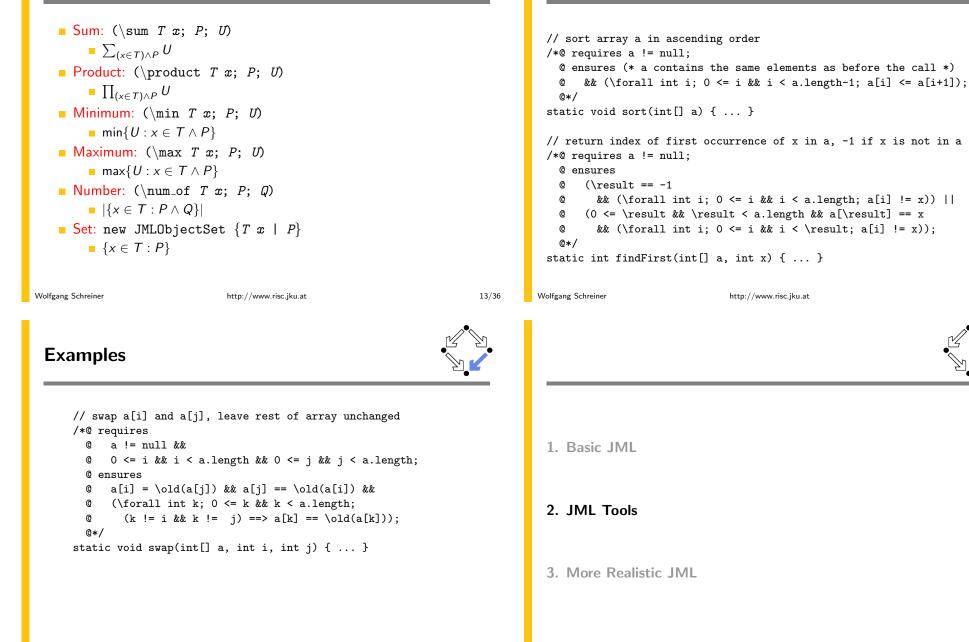

11/36

10/36

The JML Expression Language (Contd)

Examples

14/36

Common JML Tools

- Type checker jml
 - Checks syntactic and type correctness.
- Runtime assertion checker compiler jmlc
 - Generates runtime assertions from (some) JML specifications.
- Executable specification compiler jmle
 - Generates executable code from (some) JML specifications.
- JML skeleton specification generator jmlspec
 - Generates JML skeleton files from Java source files.
- Document generator jmldoc
 - Generates HTML documentation in the style of javadoc.
- Unit testing tool junit
 - Generates stubs for the *JUnit* testing environment using specifications as test conditions.

Simple GUI launched by jml-launcher.

```
Wolfgang Schreiner
```

http://www.risc.jku.at

Runtime Assertion Checking

17/36

```
> jml -Q Account.java
> jmlc -Q Account.java
> jmlrac Account
Exception in thread "main"
  org.jmlspecs.jmlrac.runtime.JMLInternalPreconditionError:
  by method Account.withdraw
        at Account.main(Account.java:1486)
```

A bit little information.

Wolfgang Schreiner

```
public class Account {
 private /*@ spec_public @*/ int bal;
  . . .
 //@ public invariant bal >= 0;
 /*@ requires amt > 0 && amt <= bal;</pre>
    @ assignable bal;
    @ ensures bal == \old(bal) - amt; @*/
 public void withdraw(int amt) {
    bal -= amt;
 }
 public static void main(String[] args) {
    Account acc = new Account(100);
   acc.withdraw(200):
    System.out.println("Balance after withdrawal: " + acc.balance());
 3
```

```
Wolfgang Schreiner
```

}

Example

```
http://www.risc.jku.at
```

18/36

20/36

OpenJML

A replacement for the JML toolset (under development).

amir!27> openjmlrac Account.java java -jar /software/openjml/openjml.jar -rac Account.java Note: /software/openjml/openjml.jar(specs17/java/util/Arrays.jml) uses unchecked or unsafe operations. Note: Recompile with -Xlint:unchecked for details. amir!28> openjmlrun Account java -cp /software/openjml/jmlruntime.jar:. Account Account.java:48: JML precondition is false acc.withdraw(200);

Account.java:27: Associated declaration: Account.java:48: /*@ requires amt > 0 && amt <= bal;</pre>

```
Balance after withdrawal: -100
```

http://openiml.org.

Wolfgang Schreiner

Other Third Party JML Tools

A large number of tools uses/supports JML.

- Mobius Program Verification Environment
 - Based on Eclipse, integrates common JML tools and ESC/Java2.
- Sireum/Kiasan for Java
 - Automatic verification and test case generation toolset.
- Modern Jass
 - Design by contract tool.
- JMLUnitNG
 - Test generation tool.
- ESC/Java2
 - Extendes static checking (later).
- KeY Verifier
 - Computer-assisted verification (later).
- ...

Support different versions of JML/Java, for current state, see http://www.jmlspecs.org/download.shtml

Wolfgang Schreiner

http://www.risc.jku.at

21/36

- 1. Basic JML
- 2. JML Tools

3. More Realistic JML

Practical Use

Recommended use with JML-annotated Java files.

- First compile with javac.
 - Check syntactic and type correctness of Java source.
- Then compile with jml (or openjml).
 - Check syntactic and type correctness of JML annotations.
- Then compile with escjava2 (or openjml -esc).
 - Check semantic consistency of JML annotations.
 - More on ESC/Java2 later.

Errors can be made at each level.

Wolfgang Schreiner

http://www.risc.jku.at

22/36

More Realistic JML

JML for procedural programs with side-effects and errors.

- Side-effects
 - assignable, pure
- Exceptions
 - signals

We also have to deal with the less pleasant aspects of programs.

Side Effects

```
static int q, r, x;
/*@ requires b != 0;
@ assignable q, r;
@ ensures a == b*q + r && sign(r) == sign(a) &&
@ (\forall int r0, int q0; a == b*q0+r0 && sign(r0) == sign(a);
@ abs(r) <= abs(r0)) @*/
static void quotRem(int a, int b)
{ q = a/b; r = a%b; }
```

- assignable specifies the variables that method may change.
- Default: assignable \everything.
 - Method might change any visible variable.
- Possible: assignable \nothing.
 - No effect on any variable.

Wolfgang Schreiner

http://www.risc.jku.at

25/36

27/36

int[] a = new int[10];

Arrays and Side Effects

- assignable a;
 - The pointer a may change.
 - a = new int[20];
- assignable a[*];
 - The content of a may change.

```
a[1] = 1;
```

// swap a{i] and a[j], leave rest of array unchanged
/*@ requires
@ a != null &&
@ 0 <= i && i < a.length && 0 <= j && j < a.length;
@ assignable a[*];
@ ensures
@ a[i] = \old(a[j]) && a[j] == \old(a[i]) &&
@ (\forall int k; 0 <= k && k < a.length;</pre>

```
@ ((lolul int k, 0 < k au k < d.longon,
@ (k != i && k != j) ==> a[k] == \old(a[k]));
@*/
```

```
static void swap(int[] a, int i, int j) { \ldots }
```

```
static /*@ pure @*/ int sign(int x)
{
    if (x == 0)
        return 0;
    else if (x > 0)
        return 1;
    else
        return -1;
}
```

static /*@ pure @*/ int abs(int x)
{ if (x >= 0) return x; else return -x; }

- Pure program functions may be used in specification expressions.
 - pure implies assignable \nothing.
- JML considers pure program functions as mathematical functions.

Wolfgang Schreiner

http://www.risc.jku.at

26/36

Exceptions

static int balance;

```
/*@ assignable balance;
  @ ensures \old(balance) >= amount
  @ && balance = \old(balance)-amount;
  @ signals(DepositException e) \old(balance) < amount
  @ && balance == \old(balance); @*/
static void withdraw(int amount) throws DepositException
  {
    if (balance < amount) throw new DepositException();
    balance = balance-amount;
  }
  This method has two ways to return.
```

- Normal return: the postcondition specified by ensures holds.
- Exceptional return: an exception is raised and the postcondition specified by signals holds.

Exceptions

- Default: signals(Exception e) true;
 - Instead of a normal return, method may also raise an exception without any guarantee for the post-state.
 - Even if no throws clause is present, runtime exceptions may be raised.
- Consider: signals(Exception e) false;
 - If method returns by an exception, false holds.
 - Thus the method must not raise an exception (also no runtime exception).

We also have to take care to specify the exceptional behavior of a method!

Wolfgang Schreiner

http://www.risc.jku.at

29/36

Lightweight Specifications

This is the contract format we used up to now.

```
/*@ requires ...;
@ assignable ...;
@ ensures ...;
@ signals ...; @*/
```

- Convenient form for simple specifications.
- If some clauses are omitted, their value is *unspecified*.

So what does a (partially) unspecified contract mean?

Preconditions versus Exceptions

```
/*@ requires (\exists int x; ; a == x*b);
  @ ensures a == \result*b; @*/
static int exactDivide1(int a, int b) { ... }
```

/*@ ensures (\exists int x; ; a == x*b) && a == \result*b; @ signals(DivException e) !(\exists int x; ; a == x*b) @*/ static int exactDivide2(int a, int b) throws DivException { ... }

- exactDivide1 has precondition $P : \Leftrightarrow \exists x : a = x \cdot b$.
 - Method must not be called, if *P* is false.
 - It is the responsibility of the caller to take care of *P*.
- exactDivide2 has precondition true.
 - Method may be also called, if P is false.
 - Method must raise DivException, if P is false.
 - It is the responsibility of the method to take care of *P*.

http://www.risc.jku.at

Different contracts!

Wolfgang Schreiner

30/36

Method Underspecification

If not specified otherwise, client should assume weakest possible contract:

- requires false;
 - Method should not be called at all.
- assignable \everything;
 - In its execution, the method may change any visible variable.
- ensures true;
 - If the method returns normally, it does not provide any guarantees for the post-state.
- signals(Exception e) true;
 - Rather than returning, the method may also throw an arbitrary exception; in this case, there are no guarantees for the post-state.

Defensive programming: for safety, client should avoid implicit assumptions.

Method Underspecification

If not specified otherwise, method should implement strongest possible contract:

- requires true;
 - Method might be called in any pre-state.
- assignable \nothing;
 - In its execution, the method must not change any visible variable.
- signals(Exception e) false;
 - Method should not throw any exception.

Defensive programming: for safety, method should satisfy implicit client assumptions (as far as possible).

Wolfgang Schreiner

http://www.risc.jku.at

33/36

Heavyweight Specification Defaults

If not specified otherwise, we have the following defaults:

- requires true;
 - Method may be called in any state.
- assignable \everything;
 - In its execution, the method may change every visible variable.
- ensures true;
 - After normal return, no guarantees for the post-state.
- signals(Exception e) true;
 - Rather than returning, the method may also throw an arbitrary exception; then there are no guarantees for the post-state.

Method must not make assumptions on the pre-state, caller must not make assumptions on the method behavior and on the post-state.

/*@ public normal_behavior

- @ requires ...;
- @ assignable ...;
- @ ensures ...;
- @ also public exceptional_behavior
- @ requires ...;
- @ assignable ...;
- @ signals(...) ...; @*/
- A normal behavior and (one or multiple) exceptional behaviors.
 - Method must implement all behaviors.
- Each behavior has a separate precondition.
 - What must hold, such that method can exhibit this behavior.
 - If multiple hold, method may exhibit any corresponding behavior.
 - If none holds, method must not be called.
- For each behavior, we can specify
 - the visibility level (later), the assignable variables, the postcondition.

```
Wolfgang Schreiner
```

http://www.risc.jku.at

34/36

Example

static int balance;

/*@ public normal_behavior

- @ requires balance >= amount;
- @ assignable balance;
- @ ensures balance = \old(balance)-amount;
- @ also public exceptional_behavior
- @ requires balance < amount;</pre>
- @ assignable \nothing;
- @ signals(DepositException e) true;
- @*/

}

Wolfgang Schreiner

static void withdraw(int amount) throws DepositException
{

if (balance < amount) throw new DepositException(); balance = balance-amount;

Clearer separation of normal behavior and exceptional behavior.

35/36
