# Verifying Java Programs

- **Extended static checking of Java programs:**
  - Even if no error is reported, a program may violate its specification.
    - Unsound calculus for verifying while loops.
  - Even correct programs may trigger error reports:
    - Incomplete calculus for verifying while loops.
    - Incomplete calculus in automatic decision procedure (Simplify).
- **Verification of Java programs:**
  - Sound verification calculus.
    - Not unfolding of loops, but loop reasoning based on invariants.
    - Loop invariants must be typically provided by user.
  - Automatic generation of verification conditions.
    - From JML-annotated Java program, proof obligations are derived.
  - Human-guided proofs of these conditions (using a proof assistant).
    - Simple conditions automatically proved by automatic procedure.

We will now deal with an integrated environment for this purpose.

# The KeY Tool

<http://www.key-project.org>

- **KeY:** environment for verification of JavaCard programs.
  - Subset of Java for smartcard applications and embedded systems.
  - Universities of Karlsruhe, Koblenz, Chalmers, 1998–
    - Beckert et al: “Deductive Software Verification – The KeY Book: From Theory to Practice”, Springer, 2016.
    - “Chapter 16: Formal Verification with KeY: A Tutorial”
- **Specification languages:** OCL and JML.
  - Original: OCL (Object Constraint Language), part of UML standard.
  - Later added: JML (Java Modeling Language).
- **Logical framework:** Dynamic Logic (DL).
  - Successor/generalization of Hoare Logic.
  - Integrated prover with interfaces to external decision procedures.
    - Simplify, CVC3, CVC4, Yices, Z3.

**Now only JML is supported as a specification language.**

# Dynamic Logic

Further development of Hoare Logic to a modal logic.

- **Hoare logic:** two separate kinds of statements.
  - Formulas  $P, Q$  constraining program states.
  - Hoare triples  $\{P\}C\{Q\}$  constraining state transitions.
- **Dynamic logic:** single kind of statement.

Predicate logic formulas extended by two kinds of modalities.

- $[C]Q$  ( $\Leftrightarrow \neg\langle C\rangle\neg Q$ )
  - Every state that can be reached by the execution of  $C$  satisfies  $Q$ .
  - The statement is trivially true, if  $C$  does not terminate.
- $\langle C\rangle Q$  ( $\Leftrightarrow \neg[C]\neg Q$ )
  - There exists some state that can be reached by the execution of  $C$  and that satisfies  $Q$ .
  - The statement is only true, if  $C$  terminates.

States and state transitions can be described by DL formulas.

# Dynamic Logic versus Hoare Logic

Hoare triple  $\{P\}C\{Q\}$  can be expressed as a DL formula.

- **Partial correctness interpretation:**  $P \Rightarrow [C]Q$ 
  - If  $P$  holds in the current state and the execution of  $C$  reaches another state, then  $Q$  holds in that state.
  - Equivalent to the partial correctness interpretation of  $\{P\}C\{Q\}$ .
- **Total correctness interpretation:**  $P \Rightarrow \langle C \rangle Q$ 
  - If  $P$  holds in the current state, then there exists another state that can be reached by the execution of  $C$  in which  $Q$  holds.
  - If  $C$  is deterministic, there exists at most one such state; then equivalent to the total correctness interpretation of  $\{P\}C\{Q\}$ .

**For deterministic programs, the interpretations coincide.**

# Advantages of Dynamic Logic

---

Modal formulas can also occur in the context of quantifiers.

- **Hoare Logic:**  $\{x = a\} y := x * x \{x = a \wedge y = a^2\}$ 
  - Use of free mathematical variable  $a$  to denote the “old” value of  $x$ .
- **Dynamic logic:**  $\forall a : x = a \Rightarrow [y := x * x] x = a \wedge y = a^2$ 
  - Quantifiers can be used to restrict the scopes of mathematical variables across state transitions.

Set of DL formulas is closed under the usual logical operations.

# A Calculus for Dynamic Logic

## ■ A core language of commands (non-deterministic):

- $X := T$  ... assignment
- $C_1; C_2$  ... sequential composition
- $C_1 \cup C_2$  ... non-deterministic choice
- $C^*$  ... iteration (zero or more times)
- $F?$  ... test (blocks if  $F$  is false)

## ■ A high-level language of commands (deterministic):

- skip** = true?
- abort** = false?
- $X := T$
- $C_1; C_2$
- if**  $F$  **then**  $C_1$  **else**  $C_2$  =  $(F?; C_1) \cup ((\neg F)?; C_2)$
- if**  $F$  **then**  $C$  =  $(F?; C) \cup (\neg F)?$
- while**  $F$  **do**  $C$  =  $(F?; C)^*; (\neg F)?$

A calculus is defined for dynamic logic with the core command language.

# A Calculus for Dynamic Logic

## ■ Basic rules:

- Rules for predicate logic extended by general rules for modalities.

## ■ Command-related rules:

- $$\frac{\Gamma \vdash F[T/X]}{\Gamma \vdash [X := T]F}$$
- $$\frac{\Gamma \vdash [C_1][C_2]F}{\Gamma \vdash [C_1; C_2]F}$$
- $$\frac{\Gamma \vdash [C_1]F \quad \Gamma \vdash [C_2]F}{\Gamma \vdash [C_1 \cup C_2]F}$$
- $$\frac{\Gamma \vdash F \Rightarrow [C]F}{\Gamma \vdash F \Rightarrow [C^*]F}$$
- $$\frac{\Gamma \vdash F \Rightarrow G}{\Gamma \vdash [F?]G}$$

From these, Hoare-like rules for the high-level language can be derived.

# Objects and Updates

Calculus has to deal with the pointer semantics of Java objects.

- **Aliasing:** two variables  $o, o'$  may refer to the same object.
  - Field assignment  $o.a := T$  may also affect the value of  $o'.a$ .
- **Update formulas:**  $\{o.a \leftarrow T\}F$ 
  - Truth value of  $F$  in state after the assignment  $o.a := T$ .

- **Field assignment rule:**

$$\frac{\Gamma \vdash \{o.a \leftarrow T\}F}{\Gamma \vdash [o.a := T]F}$$

- **Field access rule:**

$$\frac{\Gamma, o = o' \vdash F(T) \quad \Gamma, o \neq o' \vdash F(o'.a)}{\Gamma \vdash \{o.a \leftarrow T\}F(o'.a)}$$

- Case distinction depending on whether  $o$  and  $o'$  refer to same object.
- Only applied as last resort (after all other rules of the calculus).

**Considerable complication of verifications.**

# The KeY Prover

## > KeY &

The screenshot displays the KeY 2.8.0 interface. The main window shows a proof tree with nodes like 'wellFormed(heap)', 'A ~self\_25 == null', and 'A self\_25.<<created> = TRUE'. A modal dialog box titled 'The KeY Project' is overlaid in the center, displaying the 'KeY 2.8' logo and project information. The right pane shows the source code for 'SumAndMax.java', including a 'normal\_behaviour' contract and a 'sumAndMax' method. The bottom status bar indicates 'Strategy: Applied 2217 rules (6.7 sec), closed 33 goals, 0 remaining'.

# A Simple Example

## File/Load Example/Getting Started/Sum and Max

```
class SumAndMax {
    int sum; int max;
    /*@ requires (\forall int i;
        @ 0 <= i && i < a.length; 0 <= a[i]);
        @ assignable sum, max;
        @ ensures (\forall int i;
            @ 0 <= i && i < a.length; a[i] <= max);
        @ ensures (a.length > 0 ==>
            @ (\exists int i;
                @ 0 <= i && i < a.length;
                @ max == a[i]));
        @ ensures sum == (\sum int i;
            @ 0 <= i && i < a.length; a[i]);
        @ ensures sum <= a.length * max;
    */
    void sumAndMax(int[] a) {
        sum = 0;
        max = 0;
        int k = 0;
        /*@ loop_invariant
            @ 0 <= k && k <= a.length
            @ && (\forall int i;
                @ 0 <= i && i < k; a[i] <= max)
            @ && (k == 0 ==> max == 0)
            @ && (k > 0 ==> (\exists int i;
                @ 0 <= i && i < k; max == a[i]))
            @ && sum == (\sum int i;
                @ 0 <= i && i < k; a[i])
            @ && sum <= k * max;
            @ assignable sum, max;
            @ decreases a.length - k;
        */
        while (k < a.length) {
            if (max < a[k]) max = a[k];
            sum += a[k];
            k++;
        } }
}
```

# A Simple Example (Contd)

Proof Management

By Target | By Proof

Contract Targets

- SumAndMax
  - sumAndMax(int[])

Contracts

```
JML.normal_behavior operation contract 0
self.sumAndMax(a) catch(exc)
pre  $\forall \text{int } i; (0 \leq i \wedge i < a.length \wedge \text{inInt}(i) \rightarrow 0 \leq a[i]) \wedge (\text{self}.\langle \text{inv} \rangle \wedge \neg a = \text{null})$ 
post  $\forall \text{int } i; (0 \leq i \wedge i < a.length \wedge \text{inInt}(i) \rightarrow a[i] \leq \text{self.max}) \wedge ((a.length > 0 \rightarrow \exists \text{int } i; (0 \leq i \wedge i < a.length$ 
mod  $\{(self, \text{SumAndMax}::\$sum)\} \cup \{(self, \text{SumAndMax}::\$max)\}$ 
termination diamond
```

Start Proof Cancel

Generate the proof obligations and choose one for verification.

# A Simple Example (Contd'2)

The screenshot displays the KeY2.8.0 IDE with the following components:

- Loaded Proofs:** Lists loaded models and contracts, such as `SumAndMax[SumAndMax::sumAndMax(0)]_M4_normal_behavior_operation_contract.0`.
- Proof Tree:** Shows a goal labeled `OPEN GOAL`.
- Source:** Contains the Java code for `SumAndMax.java`, including a class definition, a `normal_behaviour` contract, and a `sumAndMax` method.
- Dynamic Logic:** A large block of text representing the proof obligation, starting with `wellFormed(heap)` and involving quantifiers over `int i` and `int k`, and references to the `sumAndMax` method and its contracts.

The proof obligation in Dynamic Logic.

## A Simple Example (Contd'3)

```
==>
  wellFormed(heap)
  & ...
  & (( \forall int i;
      ((0 <= i & i < a.length) & inInt(i) -> 0 <= a[i])
      & ((self_25.<inv> & (!a = null))))))
-> {heapAtPre_0:=heap || _a:=a}
  \<{
    exc_25=null;try {
      self_25.sumAndMax(_a)@SumAndMax;
    } catch (java.lang.Throwable e) { exc_25=e; }
  }> ( (\forall int i;
      ( (0 <= i & i < a.length) & inInt(i) -> a[i] <= self_25.max)
      & (( ( a.length > 0
          -> \exists int i;
              (( (0 <= i & i < a.length) & inInt(i) & self_25.max = a[i])))
          & (( self_25.sum = javaCastInt(bsum{int i;}(0, a.length, a[i]))
              & (( self_25.sum <= javaMulInt(a.length, self_25.max)
                  & self_25.<inv>))))))))
      & (exc_25 = null)
      & \forall Field f;
        \forall java.lang.Object o;
          ( (o, f) \in {(self_25, SumAndMax::$sum)}
            \cup {(self_25, SumAndMax::$max)}
            | !o = null
            & !o.<created>@heapAtPre_0 = TRUE
            | o.f = o.f@heapAtPre_0))
```

Press button “Start/stop automated proof search” (green arrow).

# Linear Search

```
/*@ requires a != null;
   @ assignable \nothing;
   @ ensures
   @   (\result == -1 &&
   @     (\forall int j; 0 <= j && j < a.length; a[j] != x)) ||
   @   (0 <= \result && \result < a.length && a[\result] == x &&
   @     (\forall int j; 0 <= j && j < \result; a[j] != x));
   @*/
public static int search(int[] a, int x) {
    int n = a.length; int i = 0; int r = -1;
    /*@ loop_invariant
       @   a != null && n == a.length && 0 <= i && i <= n &&
       @   (\forall int j; 0 <= j && j < i; a[j] != x) &&
       @   (r == -1 || (r == i && i < n && a[r] == x));
       @ decreases r == -1 ? n-i : 0;
       @ assignable r, i; // required by KeY, not legal JML
       @*/
    while (r == -1 && i < n) {
        if (a[i] == x) r = i; else i = i+1;
    }
    return r;
}
```

# Linear Search (Contd)

The screenshot displays the KeY2.8.0 IDE interface. On the left, the 'Loaded Proofs' pane shows several proof goals, with the last one selected. Below it, the 'Proof' tree shows a 'Normal Execution (a != null)' goal. The main editor area shows the source code of the `search` method in `Main0.java`. A 'Proof Statistics' dialog is open, showing the following data:

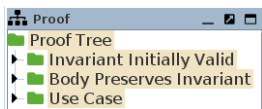

Proved.	
Nodes	594
Branches	9
Interactive steps	0
Symbolic execution steps	59
Automode time	920ms
Avg. time per step	1.551ms
Rule applications	
Quantifier instantiations	1
One-step Simplifier apps	82
SMT solver apps	0
Dependency Contract apps	0
Operation Contract apps	0
Block/Loop Contract apps	0
Loop invariant apps	1
Merge Rule apps	0
Total rule apps	1,559

The 'Source' window shows the following Java code:

```
1 package \linearsearch;
2
3 public class Main0
4 {
5     /*@ requires a != null;
6     @ assignable \nothing;
7     @ ensures
8     @ (\forallall int j; 0 <= j && j < a.length: a[j]
9     @ (\forallall int j; 0 <= j && j < \result; a[j]
10    @ (\forallall int j; 0 <= j && j < \result; a[j]
11    @*/
12    public static int search(int[] a, int x)
13    {
14        int n = a.length;
15        int i = 0;
16        int r = -1;
17        /*@ loop_invariant
18        @ a != null && n == a.length &&
19        @ 0 <= i && i <= n &&
20        @ (\forallall int j; 0 <= j && j < i: a[j] != x
21        @ (r == -1 | (r == i && i < n && a[i] == x)
22        @ decreases r == -1 ? n - i : 0;
23        @ assignable r, i;
24        @*/
25        while (r == -1 && i < n)
26        {
27            if (a[i] == x)
28                r = i;
29            else
30                i = i+1;
31        }
32        return r;
33    }
34 }
35
36
```

Also this verification is completed automatically.

# Proof Structure

- Multiple conditions (Tactlet option “javaLoopTreatment::teaching”):
  - Invariant initially valid.
  - Body Preserves Invariant.
  - Use Case (on loop exit, invariant implies postcondition).
- If proof fails, elaborate which part causes trouble and potentially correct program, specification, loop annotations.

For a successful proof, in general multiple iterations of automatic proof search (button “Start”) and invocation of separate SMT solvers required (button “Run Z3, Yices, CVC3, Simplify”).

# Summary

- Various academic approaches to verifying Java(Card) programs.
  - Jack: <http://www-sop.inria.fr/everest/soft/Jack/jack.html>
  - Jive: <http://www.pm.inf.ethz.ch/research/jive>
  - Mobius: <http://kindsoftware.com/products/opensource/Mobius/>
- Do not yet scale to verification of full Java applications.
  - General language/program model is too complex.
  - Simplifying assumptions about program may be made.
  - Possibly only special properties may be verified.
- Nevertheless very helpful for reasoning on Java in the small.
  - Much beyond Hoare calculus on programs in toy languages.
  - Probably all examples in this course can be solved automatically by the use of the KeY prover and its integrated SMT solvers.
- Enforce clearer understanding of language features.
  - Perhaps constructs with complex reasoning are not a good idea. . .

In a not too distant future, customers might demand that some critical code is shipped with formal certificates (correctness proofs) . . .
