http://www.risc.jku.at
1. Programs as State Relations

2. The RISC ProgramExplorer
Specification by State Predicates

- Hoare calculus and predicate transformers use state predicates.
  - Formulas that talk about a single (pre/post-)state.
  - In such a formula, a reference $x$ means “the value of program variable $x$ in the given state”.
- Relationship between pre/post-state is not directly expressible.
  - Requires uninterpreted mathematical constants.
    \[
    \{x = a\} x := x + 1 \{x = a + 1\}
    \]
- Unchanged variables have to be explicitly specified.
  \[
  \{x = a \land y = b\} x := x + 1 \{x = a + 1 \land y = b\}
  \]
- The semantics of a command $c$ is only implicitly specified.
  - Specifications depend on auxiliary state conditions $P, Q$.
    \[
    \{P\} c \{Q\} \quad \text{wp}(c, Q) = P
    \]

Let us turn our focus from individual states to pairs of states.
We introduce formulas that denote state relations.

- Talk about a pair of states (the pre-state and the post-state).
- old $x$: “the value of program variable $x$ in the pre-state”.
- var $x$: “the value of program variable $x$ in the post-state”.

We introduce the logical judgment $c : [F]^x, \ldots$

- If the execution of $c$ terminates normally, the resulting post-state is related to the pre-state as described by $F$.
- Every variable $y$ not listed in the set of variables $x, \ldots$ has the same value in the pre-state and in the post-state.

$$c : F \land \text{var } y = \text{old } y \land \ldots$$

$$x := x + 1 : [\text{var } x = \text{old } x + 1]^x$$

$$x := x + 1 : \text{var } x = \text{old } x + 1 \land \text{var } y = \text{old } y \land \text{var } z = \text{old } z \land \ldots$$

We will discuss the termination of commands later.
State Relation Rules

\[ c : [F]^{xs} \quad y \not\in xs \]
\[ \Rightarrow c : [F \land \text{var } y = \text{old } y]^{xs \cup \{y\}} \]

**skip**: \([\text{true}]^{\emptyset}\)

**abort**: \([\text{true}]^{\emptyset}\)

\[ x = e : [\text{var } x = e']^{\{x\}} \]

\[ c_1 : [F_1]^{xs} \quad c_2 : [F_2]^{xs} \]
\[ \Rightarrow c_1 ; c_2 : [\exists ys : F_1[ys/var \ xs] \land F_2[ys/\text{old } xs]]^{xs} \]

\[ c : [F]^{xs} \]
**if** \(e\) **then** \( c : [\text{if } e' \text{ then } F \text{ else var } xs = \text{old } xs]^{xs} \)**

\[ c_1 : [F_1]^{xs} \quad c_2 : [F_2]^{xs} \]
**if** \(e\) **then** \(c_1\) **else** \(c_2 : [\text{if } e' \text{ then } F_1 \text{ else } F_2]^{xs}\)**

\[ c : [F]^{xs} \]
\[ \vdash \forall xs, ys, zs : I[xs/\text{old } xs, ys/var \ xs] \land e[ys/xs] \land F[ys/\text{old } xs, zs/var \ xs] \Rightarrow I[xs/\text{old } xs, zs/var \ xs] \]
\[ \Rightarrow I[xs/\text{old } xs, zs/var \ xs] \]

**while** \(e\) **do** \(\{l, t\} c : [\neg e'' \land (I[old \ xs/var \ xs] \Rightarrow I)]^{xs}\)

if \(e\) then \(F_1\) else \(F_2\) \(\Leftrightarrow (e \Rightarrow F_1) \land (\neg e \Rightarrow F_2)\)

\(e' := e[\text{old } xs/xs], e'' := e[\text{var } xs/xs]\) (for all program variables \(xs\))

Wolfgang Schreiner  
http://www.risc.jku.at 5/46
Example

\[ c_1 = y := y + 1; \]
\[ c_2 = x := x + y \]
\[ c_1 : [\text{var } y = \text{old } y + 1]^y \]
\[ c_2 : [\text{var } x = \text{old } x + \text{old } y]^x \]
\[ c_1 : [\text{var } y = \text{old } y + 1 \land \text{var } x = \text{old } x]^{x,y} \]
\[ c_2 : [\text{var } x = \text{old } x + \text{old } y \land \text{var } y = \text{old } y]^{x,y} \]
\[ c_1; c_2 : [\exists x_0, y_0 : \]
\[ y_0 = \text{old } y + 1 \land x_0 = \text{old } x \land \]
\[ \text{var } x = x_0 + y_0 \land \text{var } y = y_0]^{x,y} \]
\[ c_1; c_2 : [\text{var } x = \text{old } x + \text{old } y + 1 \land \text{var } y = \text{old } y + 1]^{x,y} \]

Mechanical translation and logical simplification.
Loops

\[ c : [F]^{xs} \]
\[ \vdash \forall xs, ys, zs : I[xs/old xs, ys/var xs] \land e[ys/xs] \land F[ys/old xs, zs/var xs] \Rightarrow I[xs/old xs, zs/var xs] \]

\[ \text{while } e \text{ do } \{l, t\} \quad c : [\neg e'' \land (I[old xs/var xs] \Rightarrow l)]^{xs} \]

\[ w = \text{while } i < n \text{ do } \{l, t\} \quad (s := s + i; i := i + 1) \]
\[ l \iff 0 \leq \text{var } i \leq \text{old } n \land \text{var } s = \sum_{j=0}^{\text{var } i-1} j \]

\[ (s := s + i; i := i + 1) : [\text{var } s = \text{old } s + \text{old } i \land \text{var } i = \text{old } i + 1]^{s,i} \]
\[ \vdash \forall s_x, s_y, s_z, i_x, i_y, i_z : \]
\[ (0 \leq i_y \leq \text{old } n \land s_y = \sum_{j=0}^{i_y-1} j) \land i_y < \text{old } n \land (s_z = s_y + i_y \land i_z = i_y + 1) \Rightarrow \]
\[ 0 \leq i_z \leq \text{old } n \land s_z = \sum_{j=0}^{i_z-1} j \]

\[ w : [\neg(\text{var } i < \text{var } n) \land (0 \leq \text{old } i \leq \text{old } n \land \text{old } s = \sum_{j=0}^{\text{old } i-1} j \Rightarrow l)]^{s,i} \]

The loop relation is derived from the invariant (not the loop body); we have to prove the preservation of the loop invariant.
Example

\[ c = \]
\[
\begin{align*}
\text{if } n < 0 & \quad s := -1 \\
\text{else} & \\
\quad s := 0 \\
\quad i := 0 \\
\text{while } i < n \text{ do } \{l, t\} & \\
\quad s := s + i \\
\quad i := i + 1
\end{align*}
\]

\[ l \Leftrightarrow 0 \leq \text{var } i \leq \text{old } n \land \text{var } s = \sum_{j=0}^{\text{var } i - 1} j \]

\[ t = \text{old } n - \text{old } i \]

\[ c : [\text{if old } n < 0 \\
\quad \text{then var } i = \text{old } i \land \text{var } s = -1 \\
\quad \text{else var } i = \text{old } n \land \text{var } s = \sum_{j=0}^{\text{old } n - 1} j]^{s,i} \]

Let us calculate this “semantic essence” of the program.
Example

c = if \( n < 0 \) then \( s := -1 \) else \( b \)
\( b = (s := 0; i := 0; w) \)
\( w = \text{while } i < n \text{ do } \{l, t\} \) (\( s := s + i; i = i + 1 \))

\( s := 0 : [\text{var } s = 0]^s \)
\( s := 0 : [\text{var } s = 0 \land \text{var } i = \text{old } i]^s,i \)

\( i := 0 : [\text{var } i = 0]^i \)
\( i := 0 : [\text{var } i = 0 \land \text{var } s = \text{old } s]^s,i \)

\( s := 0; i := 0 : [\exists s_0, i_0 : s_0 = 0 \land i_0 = \text{old } i \land \text{var } i = 0 \land \text{var } s = s_0]^s,i \)
\( s := 0; i := 0 : [\text{var } s = 0 \land \text{var } i = 0]^s,i \)

\( w : \neg(\text{var } i < \text{var } n) \land (0 \leq \text{old } i \leq \text{old } n \land \text{old } s = \sum_{j=0}^{\text{old } i} j \Rightarrow l)]^s,i \)
\( w : [\text{var } i \geq \text{old } n \land (0 \leq \text{old } i \leq \text{old } n \land \text{old } s = \sum_{j=0}^{\text{old } i} j \Rightarrow l)]^s,i \)
Example

c = if \( n < 0 \) then \( s := -1 \) else \( b \)

\( b = (s := 0; i := 0; w) \)

\( w = \text{while } i < n \text{ do } \{ l, t \} (s := s + i; i = i + 1) \)

\( s := 0; i := 0 : [\text{var } s = 0 \land \text{var } i = 0]^{s,i} \)

\( w : [\text{var } i \geq \text{old } n \land (0 \leq \text{old } i \leq \text{old } n \land \text{old } s = \sum_{j=0}^{\text{old } i-1} j \Rightarrow l)]^{s,i} \)

\( b : [\exists s_0, i_0 : s_0 = 0 \land i_0 = 0 \land \)

\( \quad \text{var } i \geq \text{old } n \land (0 \leq i_0 \leq \text{old } n \land s_0 = \sum_{j=0}^{i_0-1} j \Rightarrow l)]^{s,i} \)

\( b : [\exists s_0, i_0 : s_0 = 0 \land i_0 = 0 \land \)

\( \quad \text{var } i \geq \text{old } n \land (0 \leq \text{old } n \Rightarrow l)]^{s,i} \)

\( b : [\text{var } i \geq \text{old } n \land \)

\( \quad (0 \leq \text{old } n \Rightarrow 0 \leq \text{var } i \leq \text{old } n \land \text{var } s = \sum_{j=0}^{\text{var } i-1} j)]^{s,i} \)

\( b : [\text{var } i \geq \text{old } n \land \)

\( \quad (0 \leq \text{old } n \Rightarrow \text{var } i = \text{old } n \land \text{var } s = \sum_{j=0}^{\text{old } n-1} j)]^{s,i} \)
Example

c = if n < 0 then s := −1 else b

b = (s := 0; i := 0; w)

w = while i < n do {l, t} (s := s + i; i = i + 1)

s := −1 : [var s = −1]s

s := −1 : [var i = old i ∧ var s = −1]s,i

b : [var i ≥ old n ∧
(0 ≤ old n ⇒ var i = old n ∧ var s = \sum_{j=0}^{n-1} j)]s,i

c : [if old n < 0
then var i = old i ∧ var s = −1
else var i ≥ old n ∧
(0 ≤ old n ⇒ var i = old n ∧ var s = \sum_{j=0}^{n-1} j)]s,i

c : [if old n < 0
then var i = old i ∧ var s = −1
else var i = old n ∧ var s = \sum_{j=0}^{\text{old } n-1} j)]s,i
Partial Correctness

- Specification \((xs, P, Q)\)
  - Set of program variables \(xs\) (which may be modified).
  - Precondition \(P\) (a formula with “old \(xs\)” but no “var \(xs\)”).
  - Postcondition \(Q\) (a formula with both “old \(xs\)” and “var \(xs\)”).

- Partial correctness of implementation \(c\)
  1. Derive \(c : [F]^{xs}\).
  2. Prove \(F \Rightarrow (P \Rightarrow Q)\)
     - Or: \(P \Rightarrow (F \Rightarrow Q)\)
     - Or: \((P \land F) \Rightarrow Q\)

Verification of partial correctness leads to the proof of an implication.
Relationship to Other Calculi

Let all state conditions refer via “old xs” to program variables xs.

Hoare Calculus
- For proving \( \{P\} c \{Q\} \),
- it suffices to derive \( c : [F]^{xs} \)
- and prove \( P \land F \Rightarrow Q[\text{var} \: xs/\text{old} \: xs] \).

Predicate Transformers
- Assume we can derive \( c : [F]^{xs} \).
- If \( c \) does not contain loops, then
  \[
  \text{wp}(c, Q) = \forall xs : F[\text{xs/var} \: xs] \Rightarrow Q[\text{xs/old} \: xs] \\
  \text{sp}(c, P) = \exists xs : P[\text{xs/old} \: xs] \land F[\text{xs/old} \: xs, \text{old} \: xs/\text{var} \: xs]
  \]
- If \( c \) contains loops, the result is still a valid pre/post-condition but not necessarily the weakest/strongest one.

A generalization of the previously presented calculi.
Termination

- We introduce a judgment $c \downarrow T$.
  - State condition $T$ (a formula with “old xs” but no “var xs”).
- Starting with a pre-state that satisfies condition $T$ the execution of command $c$ terminates.
- **Total correctness** of implementation $c$.
  - Specification $(xs, P, Q)$.
- Derive $c \downarrow T$.
- Prove $P \Rightarrow T$.

Also verification of termination leads to the proof of an implication.
Termination Condition Rules

\[
\begin{align*}
\text{skip} & \downarrow \text{true} & \text{abort} & \downarrow \text{true} & x & := e & \downarrow \text{true} \\
& & c_1 & \downarrow T_1 & c_2 & \downarrow T_2 & \quad \frac{c_1; c_2 \downarrow T_1 \land \text{wp}(c_1, T_2)}{c \downarrow T} \\
& & & & & & \quad \frac{\text{if } e \text{ then } c \downarrow e' \Rightarrow T}{\text{if } e \text{ then } c_1 \text{ else } c_2 \downarrow \text{if } e' \text{ then } T_1 \text{ else } T_2} \\
& & c_1 & \downarrow T_1 & c_2 & \downarrow T_2 & \quad \frac{c : [F]^{xs} \quad c \downarrow T}{\vdash \forall xs, ys, zs : 
\begin{align*}
I[xs/\text{old } xs, ys/\text{var } xs] \land e[ys/xs] \land F[ys/\text{old } xs, zs/\text{var } xs] \land t[ys/\text{old } xs] \geq 0 \Rightarrow \\
T[ys/\text{old } xs] \land 0 \leq t[zs/\text{old } xs] < t[ys/\text{old } xs]
\end{align*}
\text{while } e \text{ do } \{I, t\} \quad c \downarrow t \geq 0}
\end{align*}
\]

In every iteration of a loop, the loop body must terminate and the termination term must decrease (but not become negative).
Example

\[
c =
\begin{align*}
  &\textbf{if } n < 0 \\
  &\quad s := -1 \\
  \textbf{else} \\
  &\quad s := 0 \\
  &\quad i := 0 \\
  \textbf{while } i < n \textbf{ do } \{ l, t \} \\
  &\quad s := s + i \\
  &\quad i := i + 1 \\
\end{align*}
\]

\[
l \Leftrightarrow 0 \leq \text{var } i \leq \text{old } n \land \text{var } s = \sum_{j=0}^{\text{var } i - 1} j \\
t = \text{old } n - \text{old } i
\]

\[
c \downarrow \text{if old } n < 0 \text{ then true else } \ldots \\
c \downarrow \text{if old } n < 0 \text{ then true else old } n \geq 0 \\
c \downarrow \text{true}
\]

We still have to prove the constraint on the loop iteration.
Example

\[ s := s + i; \quad i := i + 1 \quad \downarrow \text{true} \]

\[ \forall s_x, s_y, s_z, i_x, i_y, i_z : \]
\[ (0 \leq i_y \leq \text{old } n \land s_y = \sum_{j=0}^{i_y-1} j) \land \]
\[ i_y < \text{old } n \land \]
\[ (s_z = s_y + i_y \land i_z = i_y + 1) \land \]
\[ \text{old } n - i_y \geq 0 \quad \Rightarrow \]
\[ \text{true} \land \]
\[ 0 \leq \text{old } n - i_z < \text{old } n - i_y \]

Also this constraint is simple to prove.
Abortion

Also abortion can be ruled out by proving side conditions in the usual way.

See the report for the full calculus.
1. Programs as State Relations

2. The RISC ProgramExplorer
The RISC ProgramExplorer

- An integrated environment for program reasoning.
  - Research Institute for Symbolic Computation (RISC), 2008–.
  - http://www.risc.jku.at/research/formal/software/ProgramExplorer
  - Integrates the RISC ProofNavigator for computer-assisted proving.
  - Written in Java, runs under Linux (only), freely available (GPL).

- Programs written in “MiniJava”.
  - Subset of Java with full support of control flow interruptions.
  - Value (not pointer) semantics for arrays and objects.

- Theories and specifications written in a formula language.
  - Derived from the language of the RISC ProofNavigator.

- Semantic analysis and verification.
  - Program methods are translated into their “semantic essence”.
    - Open for human inspection.
  - From the semantics, the verification tasks are generated.
    - Solved by automatic decision procedure or interactive proof.

Tight integration of executable programs, declarative specifications, mathematical semantics, and verification tasks.
Using the Software

See “The RISC ProgramExplorer: Tutorial and Manual”.

- Develop a theory.
  - File “Theory.theory” with a theory Theory of mathematical types, constants, functions, predicates, axioms, and theorems.
  - Can be also added to a program file.
- Develop a program.
  - File “Class.java” with a class Class that contains class (static) and object (non-static) variables, methods and constructors.
  - Class may be annotated by a theory (and an object invariant).
  - Methods may be annotated by method specifications.
  - Loops may be annotated by invariants and termination terms.
- Analyze method semantics.
  - Transition relations, termination conditions, . . . of the method body and its individual commands.
- Perform verification tasks.
  - Frame, postcondition, termination, preconditions, loop-related tasks, type-checking conditions.
Starting the Software

- Starting the software:
  module load ProgramExplorer (only at RISC)
  ProgramExplorer &

- Command line options:
  Usage: ProgramExplorer [OPTION]...
  OPTION: one of the following options:
  -h, --help: print this message.
  -cp, --classpath [PATH]:
    directories representing top package.

  Environment Variables:
  PE_CLASSPATH:
    the directories (separated by ":") representing the
    top package (default the current working directory)

  Task repository created/read in current working directory:
  Subdirectory .PETASKS.\timestamp (ProgramExplorer tasks)
  Subdirectory .ProofNavigator (ProofNavigator legacy)

  decreases VAR n - VAR i + 1;
@*/
{
  s = s+i;
  i = i+1;
}
}

The loop invariant and termination term (measure).
The Specification Language

Derived from the language of the RISC ProofNavigator.

- **State conditions/relations, state terms.**
  - State condition: method precondition (requires).
  - State relation: method postcondition (ensures), loop invariant (invariant).
  - State term: termination term (decreases).

- **References to program variables.**
  - OLD \( x \): the value of program variable \( x \) in the pre-state.
  - VAR \( x \): the value of program variable \( x \) in the post-state.
  - In state conditions/terms, both refer to the value in the current state.
  - If program variable is of the program type \( T \), then then OLD/VAR \( x \) is of the mathematical type \( T' \).

\[
\text{int} \rightarrow \text{Base.int} = \text{[Base.MIN_INT, Base.MAX_INT]}. 
\]

- **Function results**
  - VALUE@NEXT: the return value of a program function.
  - The value of the function call’s post-state NEXT.
The Semantics View

Wolfgang Schreiner  http://www.risc.jku.at
Select method symbol “sum” and menu entry ”Show Semantics”.

Body Knowledge

[Show Original Formulas]

Pre-State Knowledge

\[ \text{old } n < \text{Base.MAX}_{\text{INT}} \]

Effects

\[ \text{executes: false, continues: false, breaks: false, returns: true} \]
\[ \text{variables: -; exceptions:-} \]

Transition Relation

\[ \text{if old } n < 0 \text{ then} \]
\[ \text{returns@next} \wedge \text{value@next} = -1 \]
\[ \text{else} \]
\[ \text{returns@next} \]
\[ \wedge \]
\[ (\exists \text{in } \text{Base.int: in } = \text{old } n + 1 \wedge 1 \leq \text{in} \wedge \text{value@next} = \text{sum}(1, \text{in} - 1)) \]
\[ \wedge \]
\[ \text{old } n < \text{Base.MAX}_{\text{INT}} \]
\[ \text{endif} \]
A Body Command

Move the mouse pointer over the box to the left of the loop.

Statement Knowledge

[Show Original Formulas]

Pre-State Knowledge

\[ \text{old } n < \text{Base} \cdot \text{MAX}_{\text{INT}} \wedge \text{old } n \geq 0 \wedge \text{old } s = 0 \wedge \text{old } i = 1 \]

Precondition

\[ \text{old } n < \text{Base} \cdot \text{MAX}_{\text{INT}} \wedge 1 \leq \text{old } i \wedge \text{old } i \leq \text{old } n + 1 \wedge \text{old } s = \text{sum}(1, \text{old } i - 1) \]

Effects

executes: true, continues: false, breaks: false, returns: false
variables: s, i; exceptions:-

Transition Relation

\[ \text{var } i = \text{old } n + 1 \wedge \text{old } n < \text{Base} \cdot \text{MAX}_{\text{INT}} \wedge 1 \leq \text{var } i \wedge \text{var } s = \text{sum}(1, \text{var } i - 1) \]

Termination Condition

executes@now \Rightarrow \text{old } n - \text{old } i \geq -1
The Semantics Elements

- **Pre-State Knowledge**
  What is known about the pre-state of the command.

- **Precondition**
  What has to be true for the pre-state of the command such that the command may be executed.

- **Effects**
  Which kind of effects may the command have.
  - **variables**: which variables may be changed.
  - **exceptions**: which exceptions may be thrown.
  - **executes, continues, breaks, returns**: may the execution terminate normally, may it be terminated by a continue, break, return.

- **Transition Relation**
  The prestate/poststate relationship of the command.

- **Termination**
  What has to be true for the pre-state of the command such that the command terminates.

Formulas are shown after simplification (see “Show Original Formulas”).
Constraining a State

Select the loop body, enter in the box the condition VAR $s=2$ AND VAR $i=1$, press “Submit”, and move the mouse to $i=i+1$.

State Conditions

[Show Original Formulas]

Pre-State Condition

$\text{var } i = 1 \land \text{var } s = \text{var } i + 2$

Post-State Condition

$\text{var } s = 3 \land \text{var } i = 2$
The Verification Tasks

```plaintext
class Sum

method sum
  [Sum.sum] effects
  [Sum.sum] postcondition
  [Sum.sum] termination

preconditions
  [Sum.sum:0] assignment precondition
  [Sum.sum:1] while loop precondition
  [Sum.sum:2] assignment precondition
  [Sum.sum:3] assignment precondition

loops
  [Sum.sum:qvb] invariant is preserved
  [Sum.sum:qvb] measure is well-formed
  [Sum.sum:qvb] measure is decreased

  type checking conditions

specification validation (optional)
  [Sum.sum] specification is satisfiable
  [Sum.sum] specification is not trivial
```
The Verification Tasks

- **Effects**: does the method only change those global variables indicated in the method’s assignable clause?
- **Postcondition**: do the method’s precondition and the body’s state relation imply the method’s postcondition?
- **Termination**: does the method’s precondition imply the body’s termination condition?
- **Precondition**: does a statement’s prestate knowledge imply the statement’s precondition?
- **Loops**: is the loop invariant preserved, the measure well-formed (does not become negative) and decreased?
- **Type checking conditions**: are all formulas well-typed?
- **Specification validation**: does for every input that satisfies a precondition exist a result that does (not) satisfy the postcondition?

Partially solved by automatic decision procedure, partially by an interactive computer-supported proof.
The Task States

The task status is indicated by color (icon).

- **Blue (sun):** the task was solved in the current execution of the RISC ProgramExplorer (automatically or by an interactive proof).
- **Violet (partially clouded):** the task was solved in a previous execution by an interactive proof.
  - Nothing has changed, so we need not perform the proof again.
  - However, we may replay the proof to investigate it.
- **Red (partially clouded):** there exists a proof but it is either not complete or cannot be trusted any more (something has changed).
- **Red (fully clouded):** there does not yet exist a proof.

Select “Execute Task” to start/replay a proof, “Show Proof” to display a proof, “Reset Task” to delete a proof.
A Postcondition Proof
Linear Search

```java
/*@
public class Searching
{
    public static int search(int[] a, int x) /*@
    {
        int n = a.length;
        int r = -1;
        int i = 0;
        while (i < n && r == -1) /*@
        {
            if (a[i] == x)
                r = i;
            else
                i = i+1;
        }
        return r;
    }
}
```
The Representation of Arrays

The program type \texttt{int[]} is mapped to the mathematical type \texttt{Base.IntArray}.

\begin{verbatim}
theory Base
{
  ...
  IntArray: TYPE = [#value: ARRAY int OF int, length: nat, null: BOOLEAN#];
  ...
}
\end{verbatim}

- \texttt{(VAR \( a \)).length:} the number of elements in array \( a \).
- \texttt{(VAR \( a \)).value[i]:} the element with index \( i \) in array \( a \).
- \texttt{(VAR \( a \)).null:} \( a \) is the null pointer.

Program type \texttt{Class} is mapped to mathematical type \texttt{Class.Class}; \texttt{Class[]} is mapped to \texttt{Class.Array}. 

Wolfgang Schreiner http://www.risc.jku.at 39/46
theory uses Base {
    int: TYPE = Base.int;
    intArray: TYPE = Base.IntArray;
    smallestPosition: FORMULA
        FORALL(a: intArray, n: NAT, x: int):

Method Semantics

Transition Relation

\[(\exists in \in \text{Base.int}, n \in \text{Base.int}: \]
\[\quad n = \text{old } a.\text{length} \land (in \geq n \lor \text{value}@\text{next} \neq -1) \land 0 \leq in \land in \leq n \]
\[\land \]
\[\quad (\forall i \in \mathbb{Z}: 0 \leq i \land i < in \Rightarrow \text{old } a.\text{value}[i] \neq \text{old } x) \]
\[\land \]
\[\quad (\text{value}@\text{next} = -1 \]
\[\lor \]
\[\quad \text{value}@\text{next} = \text{in} \land \text{in} < n \land \text{old } a.\text{value}[\text{value}@\text{next}] = \text{old } x) \land \neg \text{old } a.\text{null} \]
\[\land \]
\[\quad \text{return}@\text{next} \]

Termination Condition

\[\text{executes}@\text{now} \Rightarrow \text{old } a.\text{length} \geq 0\]
Verification Tasks

- [Searching.search] effects
- [Searching.search] postcondition
- [Searching.search] termination

**preconditions**
- [Searching.search:0] declaration precondition
- [Searching.search:1] declaration precondition
- [Searching.search:2] while loop precondition
- [Searching.search:3] conditional precondition
- [Searching.search:4] assignment precondition

**loops**
- [Searching.search:rbl] invariant is preserved
- [Searching.search:rbl] measure is well-formed
- [Searching.search:rbl] measure is decreased

**type checking conditions**
- [Searching.(local):p3x] value is in interval
- [Searching.(local):smu] value is in interval
- [Searching.(local):unx] value is in interval

**specification validation (optional)**
Invariant Proof
Working Strategy

- Develop theory.
  - Introduce interesting theorems that may be used in verifications.
- Develop specifications.
  - Validate specifications, e.g. by showing satisfiability and non-triviality.
- Develop program with annotations.
  - Validate programs/annotations by investigating program semantics.
- Prove postcondition and termination.
  - Partial and total correctness.
  - By proofs necessity of additional theorems may be detected.
- Prove precondition tasks and loop tasks.
  - By proofs necessity of additional theorems may be detected.
- Prove mathematical theorems.
  - Validation of auxiliary knowledge used in verifications.

The integrated development of theories, specifications, programs, annotations is crucial for the design of provably correct programs.
