1/25

The KeY Tool

<http://www.key-project.org>

- KeY: environment for verification of JavaCard programs.
 - Subset of Java for smartcard applications and embedded systems.
 - Universities of Karlsruhe, Koblenz, Chalmers, 1998–
 - Beckert et al: "Verification of Object-Oriented Software: The KeY Approach", Springer, 2007. (book)
 - Ahrendt et al: "The KeY Tool", 2005. (paper)
 - Engel and Roth: "KeY Quicktour for JML", 2006. (short paper)
- Specification languages: OCL and JML.
 - Original: OCL (Object Constraint Language), part of UML standard.
 - Later added: JML (Java Modeling Language).
- Logical framework: Dynamic Logic (DL).
 - Successor/generalization of Hoare Logic.
 - Integrated prover with interfaces to external decision procedures.
 - Simplify, CVC3, Yices, Z3.

We will only deal with the tool's JML interface "JMLKeY".

Wolfgang Schreiner

<http://www.risc.jku.at>

3/25

Verifying Java Programs

■ Extended static checking of Java programs:

- Even if no error is reported, a program may violate its specification.
 - Unsound calculus for verifying while loops.
- Even correct programs may trigger error reports:
 - Incomplete calculus for verifying while loops.
 - Incomplete calculus in automatic decision procedure (Simplify).

■ Verification of Java programs:

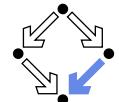

- Sound verification calculus.
 - Not unfolding of loops, but loop reasoning based on invariants.
 - Loop invariants must be typically provided by user.
- Automatic generation of verification conditions.
 - From JML-annotated Java program, proof obligations are derived.
- Human-guided proofs of these conditions (using a proof assistant).
 - Simple conditions automatically proved by automatic procedure.

We will now deal with an integrated environment for this purpose.

Wolfgang Schreiner

<http://www.risc.jku.at>

2/25

Dynamic Logic

Further development of Hoare Logic to a modal logic.

■ Hoare logic: two separate kinds of statements.

- Formulas P, Q constraining program states.
- Hoare triples $\{P\}C\{Q\}$ constraining state transitions.

■ Dynamic logic: single kind of statement.

Predicate logic formulas extended by two kinds of modalities.

■ $[C]Q$ ($\Leftrightarrow \neg(C)\neg Q$)

- Every state that can be reached by the execution of C satisfies Q .
- The statement is trivially true, if C does not terminate.

■ $(C)Q$ ($\Leftrightarrow \neg[C]\neg Q$)

- There exists some state that can be reached by the execution of C and that satisfies Q .
- The statement is only true, if C terminates.

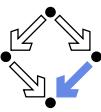

States and state transitions can be described by DL formulas.

Wolfgang Schreiner

<http://www.risc.jku.at>

4/25

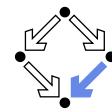

Dynamic Logic versus Hoare Logic

Hoare triple $\{P\}C\{Q\}$ can be expressed as a DL formula.

- **Partial correctness interpretation:** $P \Rightarrow [C]Q$
 - If P holds in the current state and the execution of C reaches another state, then Q holds in that state.
 - Equivalent to the partial correctness interpretation of $\{P\}C\{Q\}$.
- **Total correctness interpretation:** $P \Rightarrow \langle C \rangle Q$
 - If P holds in the current state, then there exists another state that can be reached by the execution of C in which Q holds.
 - If C is deterministic, there exists at most one such state; then equivalent to the total correctness interpretation of $\{P\}C\{Q\}$.

For deterministic programs, the interpretations coincide.

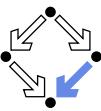

Advantages of Dynamic Logic

Modal formulas can also occur in the context of quantifiers.

- **Hoare Logic:** $\{x = a\} y := x * x \{x = a \wedge y = a^2\}$
 - Use of free mathematical variable a to denote the “old” value of x .
- **Dynamic logic:** $\forall a : x = a \Rightarrow [y := x * x] x = a \wedge y = a^2$
 - Quantifiers can be used to restrict the scopes of mathematical variables across state transitions.

Set of DL formulas is closed under the usual logical operations.

A Calculus for Dynamic Logic

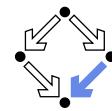

- A core language of commands (non-deterministic):

$X := T$... assignment
 $C_1; C_2$... sequential composition
 $C_1 \cup C_2$... non-deterministic choice
 C^* ... iteration (zero or more times)
 $F?$... test (blocks if F is false)

- A high-level language of commands (deterministic):

skip = true?
abort = false?
 $X := T$
 $C_1; C_2$
 $\text{if } F \text{ then } C_1 \text{ else } C_2 = (F?; C_1) \cup ((\neg F)?; C_2)$
 $\text{if } F \text{ then } C = (F?; C) \cup (\neg F)?$
 $\text{while } F \text{ do } C = (F?; C)^*; (\neg F)?$

A calculus is defined for dynamic logic with the core command language.

A Calculus for Dynamic Logic

- Basic rules:

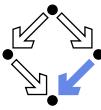

■ Rules for predicate logic extended by general rules for modalities.

- Command-related rules:

■ $\frac{\Gamma \vdash F[T/X]}{\Gamma \vdash [X := T]F}$
■ $\frac{\Gamma \vdash [C_1][C_2]F}{\Gamma \vdash [C_1; C_2]F}$
■ $\frac{\Gamma \vdash [C_1]F \quad \Gamma \vdash [C_2]F}{\Gamma \vdash [C_1 \cup C_2]F}$
■ $\frac{\Gamma \vdash F \quad \Gamma \vdash [C^*](F \Rightarrow [C]F)}{\Gamma \vdash [C^*]F}$
■ $\frac{\Gamma \vdash F \Rightarrow G}{\Gamma \vdash [F?]G}$

From these, Hoare-like rules for the high-level language can be derived.

Objects and Updates

Calculus has to deal with the pointer semantics of Java objects.

- **Aliasing:** two variables o, o' may refer to the same object.
 - Field assignment $o.a := T$ may also affect the value of $o'.a$.
- **Update formulas:** $\{o.a \leftarrow T\}F$
 - Truth value of F in state after the assignment $o.a := T$.
- **Field assignment rule:**

$$\frac{\Gamma \vdash \{o.a \leftarrow T\}F}{\Gamma \vdash [o.a := T]F}$$
- **Field access rule:**

$$\frac{\Gamma, o = o' \vdash F(T) \quad \Gamma, o \neq o' \vdash F(o'.a)}{\Gamma \vdash \{o.a \leftarrow T\}F(o'.a)}$$

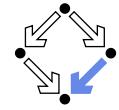

- Case distinction depending on whether o and o' refer to same object.
- Only applied as last resort (after all other rules of the calculus).

Considerable complication of verifications.

Wolfgang Schreiner

9/25

The JMLKeY Prover

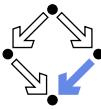

/zvol/formal/bin/startProver &

Wolfgang Schreiner

<http://www.risc.jku.at>

10/25

A Simple Example

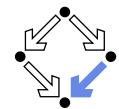

Engel et al: "KeY Quicktour for JML", 2005.

```
package paycard;
public class PayCard {
    /*@ public instance invariant
     * @ log != null
     * @ balance >= 0
     * @ limit > 0
     * @ unsuccessfulOperations >= 0;
     */
    public boolean charge(int amount) {
        if (this.balance+amount>=this.limit) {
            this.unsuccessfulOperations++;
            return false;
        } else {
            this.balance=this.balance+amount;
            return true;
        }
    }
    /*@ spec_public @*/ int limit=1000;
    /*@ spec_public @*/
    int unsuccessfulOperations;
    /*@ spec_public @*/ int id;
    /*@ spec_public @*/ int balance=0;
    /*@ spec_public @*/
    protected LogFile log;
    ...
}
```

Wolfgang Schreiner

<http://www.risc.jku.at>

11/25

A Simple Example (Contd)

Choose in Menu "File/Load" a package directory or a KeY file.

```
// paycard.key
// This file is part of KeY - Integrated Deductive Software Design
// Copyright (C) 2001-2009 Universitaet Karlsruhe, Germany
// Universitaet Koblenz-Landau, Germany
// Chalmers University of Technology, Sweden
//
// The KeY system is protected by the GNU General Public License.
// See LICENSE.TXT for details.

\classpath "classpath";
\javaSource "paycard";
\chooseContract;
```

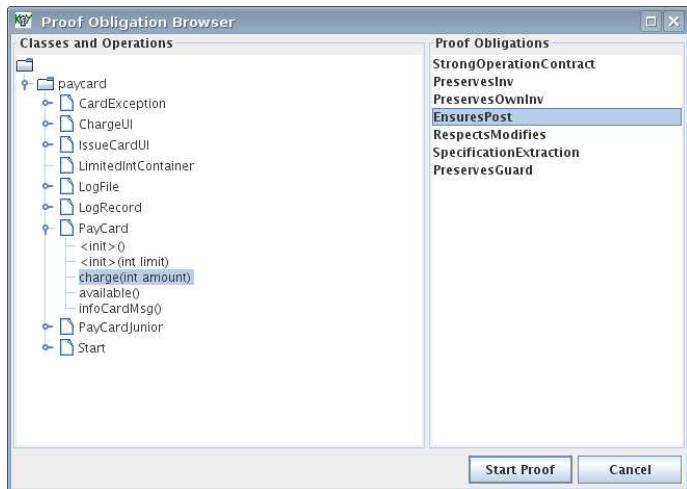

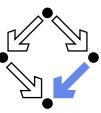

Needed (only) to look up sources of system classes.

Wolfgang Schreiner

<http://www.risc.jku.at>

12/25

A Simple Example (Contd'2)

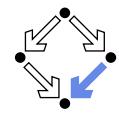

Generate the proof obligations and choose one for verification.

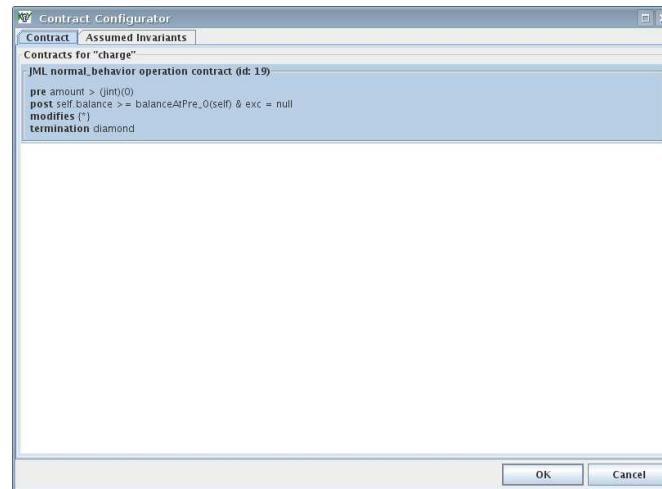

Wolfgang Schreiner

<http://www.risc.jku.at>

13/25

A Simple Example (Contd'3)

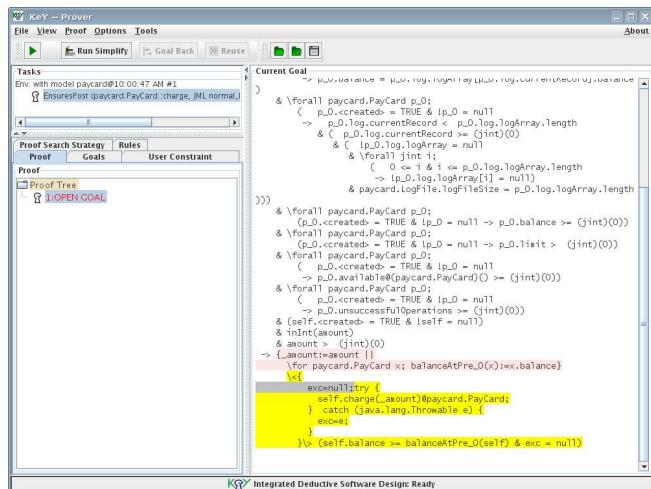

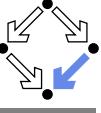

Display the chosen proof obligation and start the proof.

Wolfgang Schreiner

<http://www.risc.jku.at>

14/25

A Simple Example (Contd'4)

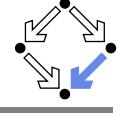

The proof obligation in Dynamic Logic.

Wolfgang Schreiner

<http://www.risc.jku.at>

15/25

A Simple Example (Contd'5)

```
==>
    inReachableState
-> \forallall int amount_lv;
  {amount:=amount_lv}
    \forallall paycard.PayCard self_PayCard_lv;
  {self_PayCard:=self_PayCard_lv}
  {_old13:=self_PayCard.balance}
    (
      !self_PayCard = null
      & self_PayCard.<created> = TRUE
      & amount > 0
      & ( !self_PayCard.log = null
        & ...
        & self_PayCard.balance >= 0
        & self_PayCard.limit > 0
        & self_PayCard.available@(paycard.PayCard()) >= 0
        & self_PayCard.unsuccessfulOperations >= 0)
    -> \<{ {
      self_PayCard.charge(amount)@paycard.PayCard;
    }
  }> self_PayCard.balance >= _old13
```

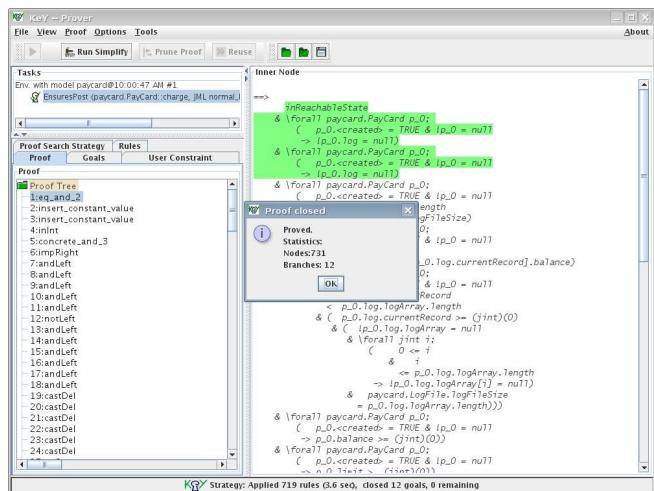

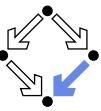

Press button "Start" (green arrow).

Wolfgang Schreiner

<http://www.risc.jku.at>

16/25

A Simple Example (Contd'6)

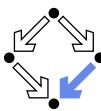

Proof runs through automatically.

Wolfgang Schreiner

<http://www.risc.jku.at>

17/25

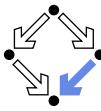

A Loop Example

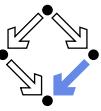

```
public class LogFile {
    /*@ public normal_behavior
     * ensures
     *  @ (\forallall int i; 0 <= i && i<logArray.length;
     *   @ logArray[i].balance <= \result.balance); */
    public /*@pure@*/
    LogRecord getMaximumRecord(){
        LogRecord max = logArray[0];
        int i=1;
        /*@ loop_invariant
         *  @ 0<=i && i <= logArray.length &&
         *   @ max!=null &&
         *   @ (\forallall int j; 0 <= j && j<i;
         *    @ max.balance >= logArray[j].balance);
         *   @ assignable max, i;
         *   @ decreases logArray.length - i; */
        while(i<logArray.length){
            LogRecord lr = logArray[i++];
            if (lr.getBalance() > max.getBalance())
                max = lr;
        }
        return max;
    }
}
```

<http://www.risc.jku.at>

18/25

A Loop Example (Contd)

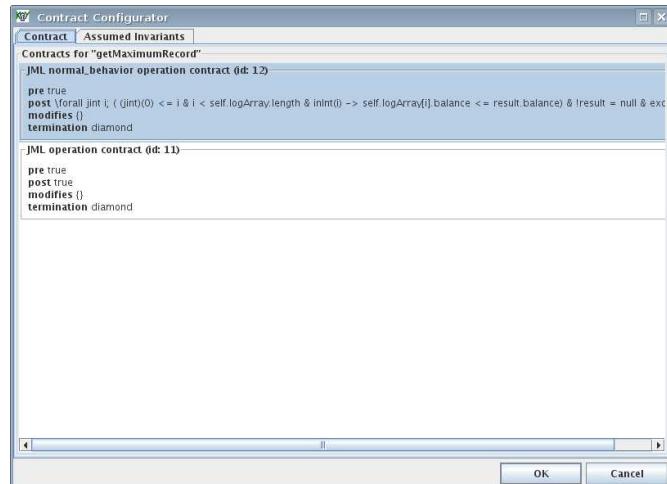

Press button "Start Proof".

Wolfgang Schreiner

<http://www.risc.jku.at>

19/25

A Loop Example (Contd'2)

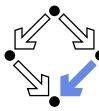

Press button "OK".

Wolfgang Schreiner

<http://www.risc.jku.at>

20/25

A Loop Example (Contd'3)

The screenshot shows the Key-Prover interface with the following details:

- Proof Search Strategy:** Proof
- Goals:** EnsuresPost (paycard.CardPayCard.charge, JML normal) with model paycard@10:00:47 AH #2
- User Constraint:** EnsuresPost (paycard.Logic.getMaximumRecord, JML normal) with model paycard@10:00:47 AH #2
- Current Goal:**

```

-->
inReachableState
& \forallall paycard.LogFile p_0;
  (p_0.<created> = TRUE & p_0.b = null => (p_0.logArray = null))
  & \forallall paycard.LogFile p_0;
    (p_0.<created> = TRUE & p_0.a = null => (p_0.logArray = null))
  & \forallall paycard.LogFile p_0;
    (p_0.<created> = TRUE & p_0.b = null => (p_0.b = null))
  & \forallall paycard.LogFile p_0;
    (p_0.<created> = TRUE & p_0.a = null => (p_0.a = null))
  & \forallall paycard.LogFile p_0;
    (p_0.<created> = TRUE & p_0.b = null => (p_0.b = null))
    & \forallall paycard.LogFile p_0;
      (p_0.<created> = TRUE & p_0.a = null
       => p_0.logArray.length = paycard.LogFile.logFileSize
       & (p_0.logArray[i].balance >= paycard.LogFile.logFileSize
          & (p_0.currentRecord = (Int)0)
          & (\forallall i: Int;
             & \forallall j: Int;
               (0 <= i & i <= p_0.logArray.length
                => p_0.logArray[i] = null))))))
  & (self.<created> = TRUE & self.b = null)
--> \{
  exclusivelytry {
    result=self.getMaximumRecord()&paycard.LogFile;
  } catch (java.lang.Throwable e) {
    exc=e;
  }
\}
  \forallall i: Int;
    (i <= 0 & i < self.logArray.length & i < Int(0)
     => self.logArray[i].balance <= result.balance)
  & (result = null
  & exc = null)
  
```

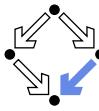

Press button “Start” (green arrow).

24/25

Summary

- Various academic approaches to verifying Java(Card) programs.
 - Jack: <http://www-sop.inria.fr/everest/soft/Jack/jack.html>
 - Jive: <http://www.sct.ethz.ch/research/jive>
 - Mobius: <http://kind.ucd.ie/productsopensource/Mobius>
- Do not yet scale to verification of large Java applications.
 - General language/program model is too complex.
 - Simplifying assumptions about program may be made.
 - Possibly only special properties may be verified.
- Nevertheless helpful for reasoning on Java in the small.
 - Much beyond Hoare calculus on programs in toy languages.
 - Probably all examples in this course can be solved automatically by the use of the KeY prover and its integrated SMT solvers.
- Enforce clearer understanding of language features.
 - Perhaps constructs with complex reasoning are not a good idea...

In a not too distant future, customers might demand that some critical code is shipped with formal certificates (correctness proofs)...
