|---|---|---|---|---|

**Name:****Matrikel-Nr.:**

**Problem 1.** Show by induction that for all real numbers  $a \notin \{0, 1, -1\}$  the following holds:

$$\forall n \in \mathbb{N} : \sum_{k=0}^n a^{2k} = \frac{a^{2n+2} - 1}{a^2 - 1}.$$

**Problem 2.** Let  $L \subseteq \Sigma^*$  be a language over the alphabet  $\Sigma = \{a, b, c, d\}$  such that a word  $w$  is in  $L$  if and only if it is either  $a$  or  $b$  or of the form  $w = ducvd$  where  $u$  and  $v$  are words of  $L$ . For example,  $dacad$ ,  $ddacbdcad$ ,  $dddcbdcdbcbddcad$  are words in  $L$ . Show by induction that every word of  $L$  contains an even number of the letter  $d$ .

Note that a *language* is just a set of words and a *word* is simply a finite sequence of letters from the alphabet.

**Problem 3.** Show  $\sqrt[3]{5} \notin \mathbb{Q}$  by an indirect proof.

*Hint:* [http://en.wikipedia.org/wiki/Square\\_root\\_of\\_2#Proofs\\_of\\_irrationality](http://en.wikipedia.org/wiki/Square_root_of_2#Proofs_of_irrationality).

**Problem 4.** Let  $L$  be the language over  $\{0, 1\}$  that consists of binary representations of non-negative multiples of 3. The set  $L$  is such that if  $w \in L$  then also  $0w \in L$ , in other words, leading zeroes in representations are OK. For example, 0, 00, 11, 001001 are in  $L$ , but 1, 010 are not.

Construct a deterministic finite-state machine  $M = (Q, \Sigma, \delta, q_0, F)$  over the alphabet  $\{0, 1\}$  such that  $L = L(M)$ . Draw the transition graph of  $M$ .

*Hint:* For a word  $w \in L$ , let  $V(w)$  be the number corresponding to the binary representation given by the word  $w$ . Let the states of  $M$  correspond to  $V(w) \bmod 3$  and note that  $V(\varepsilon) = 0$ ,  $V(w0) = 2V(w)$  and  $V(w1) = 2V(w) + 1$ .

**Problem 5.** Construct a deterministic finite state machine  $M$  over  $\Sigma = \{0, 1\}$  such that  $L(M)$  consists of all words that do not contain the string 01. *Hint:* Start by constructing a nondeterministic finite state machine  $N$  that recognizes the words that *do* contain the string 01. Proceed by converting your nondeterministic machine  $N$  to a deterministic machine  $D$  that accepts the same language. Now you are left with the task of coming up with a machine  $M$  whose language is precisely the complement of the language of  $D$ . This can be done by a small modification of  $D$ .
